

ImpactOps Maestro

An agentic back-office for NGOs & CSR — read, act, escalate, write back.

Fevourd-K is the system of record — the live NGO / CSR platform. **UiPath ImpactOps Maestro** is the agentic layer on top of it: an orchestrator agent that coordinates five specialist agents across the recurring back-office workflows, defers every money & compliance decision to a human, and writes every result back into Fevourd-K — audit trail intact.

TRY IT LIVE

● Product · HTTP 200

fevourdk.online — click-through, signed-out.

● Agent API · token-guarded

fevourdk.online/api/health — 401 without a token, 200 with one.

WHAT'S INSIDE

- 6 published UiPath agents (1 orchestrator + 5 specialists)
- 1 published API Workflow calling the live API
- The five workflows, shown running in the product
- Honest map of what's live vs. designed next

AGENT TYPE

Low-code Agents — UiPath Studio agentic processes + an API Workflow, coordinated by a Maestro orchestrator agent, with human-in-the-loop encoded in every specialist.

TEAM

Vikas Chandra Guru · Kavan Kumar KR · Nithin Annaiah · Hemanth Gowda AP

Laravel 12 · Inertia · Vue 3 · MySQL · UiPath Studio & Maestro

01 What this is, and where to look

Two systems, one honest loop. Fevourd-K owns the data and the audit trail. UiPath removes the recurring operational drudgery — but never makes the money or compliance call alone.

Fevourd-K never loses control of the data. **UiPath** never decides the money alone.

Start here, in order

- 1

Live product → <https://fevourdk.online/>
The real platform a judge can click, signed-out. Returns HTTP 200.
- 2

Live agent API → <https://fevourdk.online/api/health>
The token-guarded API UiPath calls. **401 without a token, 200 with one** — it's really deployed.
- 3

UiPath tenant → cloud.uipath.com/fevourdk
Six published agents + an API Workflow (screenshots in §04).
- 4

Orchestration walkthrough → [docs/agenthack-orchestration.md](#)
Six worked examples on real Vikasana data, with live `curl` for each endpoint.

The agentic loop — every workflow runs the same shape

Amber step = mandatory human gate. Writes never go through the agent API — they go through Fevourd-K's own authenticated routes, so control and audit stay in one system.

Architecture at a glance

02 The five workflows, shown in Fevourd-K

Each agent reads and writes a real surface of the platform. These are live screens from the running product — the same data the agents perceive and write back to.

1 Compliance Review. NGO 12A/80G/FCRA documents with verify state — the agent flags a pending certificate and routes a finding for sign-off.

2 Campaign Draft. Feed Studio — the agent assembles a donor-ready update as a *draft* (never auto-posted).

3 Field Proof. Field sessions hub — the agent checks the GPS trail against the assigned site before marking work verifiable.

4 Finance Claim. Expense claims — every money decision is routed to a human; nothing is paid automatically.

4 **Ledger write-back.** On approval, the claim posts a traceable ledger entry tagged `source: Impact0ps Maestro`.

5 **CSR Report.** Impact dashboard — the agent assembles verified proof + approved spend + compliance status into one traceable summary.

03 What we actually built in UiPath

Captured from the live cloud.uipath.com/fevourdk tenant. Six published agents and one published API Workflow — the orchestrator coordinates five specialists, each prompt-constrained to defer money & compliance to a human.

Name	Content	Edited	Status
ImpactOps Maestro	2 projects	39 minutes ago	Published
Compliance Review Agent	1 project	45 minutes ago	Published
Campaign Draft Agent	1 project	49 minutes ago	Published
Field Proof Agent	1 project	52 minutes ago	Published
Finance Claim Agent	1 project	55 minutes ago	Published
CSR Report Agent	1 project	1 hour ago	Published
Fevourd-K API Workflow	1 project	1 hour ago	Published

Published solutions. ImpactOps Maestro (orchestrator + Agentic Process) plus five specialist agents and the Fevourd-K API Workflow — all Published in UiPath Studio Web.

The screenshot shows the UiPath Studio interface for defining an agent. The left sidebar shows the project structure with 'ImpactOps Maestro' and 'Agent' selected. The main canvas displays a diagram of the 'Agent (Autonomous Agent)' with a central 'Agent' node connected to 'Escalations', 'Context', and 'Tools'. The right panel shows the 'Agent (Autonomous Agent)' configuration, including the model name 'gpt-5.4-2026-03-05' and the system prompt.

System prompt:

You are the FevourdK ImpactOps Orchestrator Agent for a UiPath Maestro Agentic Process.

Purpose:

Coordinate a public-safe NGO operations case by choosing the next specialist agent or human task. You do not approve NGOs, publish campaigns, mark field work complete, pay claims, or publish CSR reports directly.

Available specialist modules:

- Compliance Review Agent: reviews NGO intake and recommends approve, needs_review, or reject for a human verifier.
- Campaign Draft Agent: drafts public-safe campaign copy for human review.
- Field Proof Agent: reviews GPS/task proof and summarizes anomalies for human approval.
- Finance Claim Agent: reviews expense claim metadata and suggests a ledger-safe human approval action.
- CSR Report Agent: generates public-safe CSR report summaries from verified evidence.

User prompt:

Route the FevourdK ImpactOps case payload.

ImpactOps Maestro — the orchestrator agent. Its system prompt coordinates a public-safe NGO operations case by choosing the next specialist agent or human task — and explicitly does *not* approve NGOs, publish campaigns, mark field work complete, pay claims, or publish reports directly.

Finance Claim agent — the money gate. "Review NGO expense claim metadata and recommend a public-safe finance decision for a human approver. You never approve payments directly and never post to ledger directly ... **Always require human approval before payment or ledger posting.**" Privacy rules forbid exposing bank details / PAN-FCRA identifiers.

Fevourd-K API Workflow. A published UiPath API Workflow (HTTP Request, with retry-on-failure) — how agents read live Fevourd-K state over the token-guarded API before they reason.

Honest note on human gates. The human-in-the-loop is enforced today in every specialist's prompt and output contract (each emits `human_review_required` and a review artifact, never a direct action). Wiring those into UiPath **Action Center** tasks and Orchestrator **queues/triggers** is the next integration step — see §05.

04 Live today vs. designed next

We'd rather a judge trust every claim. Here's exactly what is running now and what is designed and specified but not yet wired.

Capability	State	Evidence
Fevourdk-K product (NGO/CSR platform)	Live	fevourdk.online · HTTP 200
Token-guarded agent API (6 read endpoints)	Live	<code>/api/health</code> → 401 without token, 200 with
UiPath orchestrator agent (ImpactOps Maestro)	Live	Published v1.0.0 · \$03
5 specialist agents (Compliance, Campaign, Field, Finance, CSR)	Live	Published · safety + human-gate prompts · \$03
API Workflow calling the live API	Live	Published · HTTP Request + retry · \$03
Maestro Agentic Process (Process.bpmn)	Live	Published; orchestration canvas
Action Center human-task UI (sign-off / approve-reject)	Designed	Gate logic in agent prompts; AC wiring is next
Orchestrator queues + event/cron triggers	Designed	Specified in <code>uipath/orchestrator-manifest.md</code>
Roadmap workflows: Donor Reconciliation, Grant Milestones	Designed	Specified in <code>docs/agenthack-orchestration.md</code>

Why this split is the point. The hard, novel part — agents that read a real system of record, reason under explicit safety constraints, and are built to never decide money or compliance alone — is **built and published**. The remaining items are standard UiPath plumbing (queues, triggers, Action Center tasks) on top of agents that already encode the right behaviour.

05 The live API, end to end

The agent API is deployed and token-guarded right now. Anyone can confirm the guard; judges with the demo token get live JSON.

```
curl -s -o /dev/null -w "%{http_code}" \
  https://fevourdk.online/api/health
```

401 {"error":"unauthorized"} — guard works, no token.

```
curl -s -H "Authorization: Bearer ****" \
  https://fevourdk.online/api/health
```

200 live JSON — valid Orchestrator credential.

The six read endpoints UiPath calls

```
# BASE=https://fevourdk.online/api  TOKEN=**** (masked everywhere)
GET /health
GET /ngo/vikasana/documents # ① Compliance
GET /ngo/vikasana/campaigns/clean-drinking-water-for-mandya-villages # ② Campaign
GET /field/sessions/4471/trail # ③ Field Proof
GET /ngo/vikasana/finance/claims # ④ Finance
GET /ngo/vikasana/csr/impact # ⑤ CSR Report
```

Run it yourself

- Repo `README.md` → Setup. Local API base `http://127.0.0.1:8080/api`.
- Live base `https://fevourdk.online/api` (Bearer token, masked as `****`).
- Copy any `curl` from `docs/agenthack-orchestration.md`.
- Demo NGO `vikasana` · campaign "Clean Drinking Water for Mandya Villages".

Public-safe by design

- Everything runs on a sandbox tenant — fake NGOs/amounts, redacted PII.
- Tokens masked in every doc and screenshot.
- Writes go only through Fevourd-K's authenticated routes — never the agent API.
- Every write is tagged `source: ImpactOps Maestro` in the audit trail.

The architecture in one line. Fevourd-K never loses control of the data; UiPath never makes the money or compliance decision alone.
